Why so many versions?

Cal/Val challenges:

- 8 spacecraft, each with two receiving antennas
- No control and exact knowledge of the transmitted signals originating from **31** GPS satellites
- Received signal is quite sensitive to the transmit power and CyGNSS receiver antenna gain characteristics

As a result, it is key to ensure

- the absence of inter-satellite σ_0 biases
- absence of σ_0 biases between receive antennas
- verify σ_0 dependence as a function of incidence angle
- absence of biases due to GPS block type
- no attitude variation impact to the σ_0
- no signal drift

Figure 9.1.4. Curves of $\sigma_0(\sigma_0)$ versus incidence angle, for different wind speed values.
— BLOCK IIR — BLOCK IIF — BLOCK IIR-M

CyGNSS L2 wind products (found on the PO.DAAC)

Product name	Level 1 source	Highlights
(UMICH) CyGNSS v2.1	v2.1	<ul style="list-style-type: none">-uses their in-house 'minimum variance' retrieval technique-provides two different wind speed products ('fully-developed sea' --fds--and 'young sea limited fetch' --yslf--)-excludes IIF data-25km wind speed samples provided at each DDM location
(UMICH) CyGNSS CDR v1.0	v2.1	<ul style="list-style-type: none">-performs a sigma0 correction on a track-by-track basis (inspired from NOAA⁽¹⁾)-as such, requires the use of ancillary data (Merra2 winds)-similar retrieval method as UMICH v2.1-also outputs two wind speed products-restores IIF data-lots of data being flagged-~2.5 months delay-25km wind speed samples provided at each DDM location
(UMICH) CyGNSS v3.0	v3.0	<ul style="list-style-type: none">-same retrieval technique as v2.1-also outputs two wind speed products-key difference is the use of a different Level 1 sigma0 data, which supposedly better accounts for the GPS transmit power while estimating sigma0-25km wind speed samples provided at each DDM location
NOAA CyGNSS winds v1.1	v2.1	<ul style="list-style-type: none">-performs a sigma0 correction on a track-by-track basis in order to remove unwanted intersatellite biases including 'inter-GPS block type' related biases-ancillary data used from ECMWF winds and IFREMER Wavewatch 3 significant waveheight-outputs a single wind speed product-25km 'along-track' gridded product <u>with no overlap between grid cells</u>-provided in 'near-real time'

Overview of NOAA CyGNSS wind product Version 1.1

Data processing chain and product content description

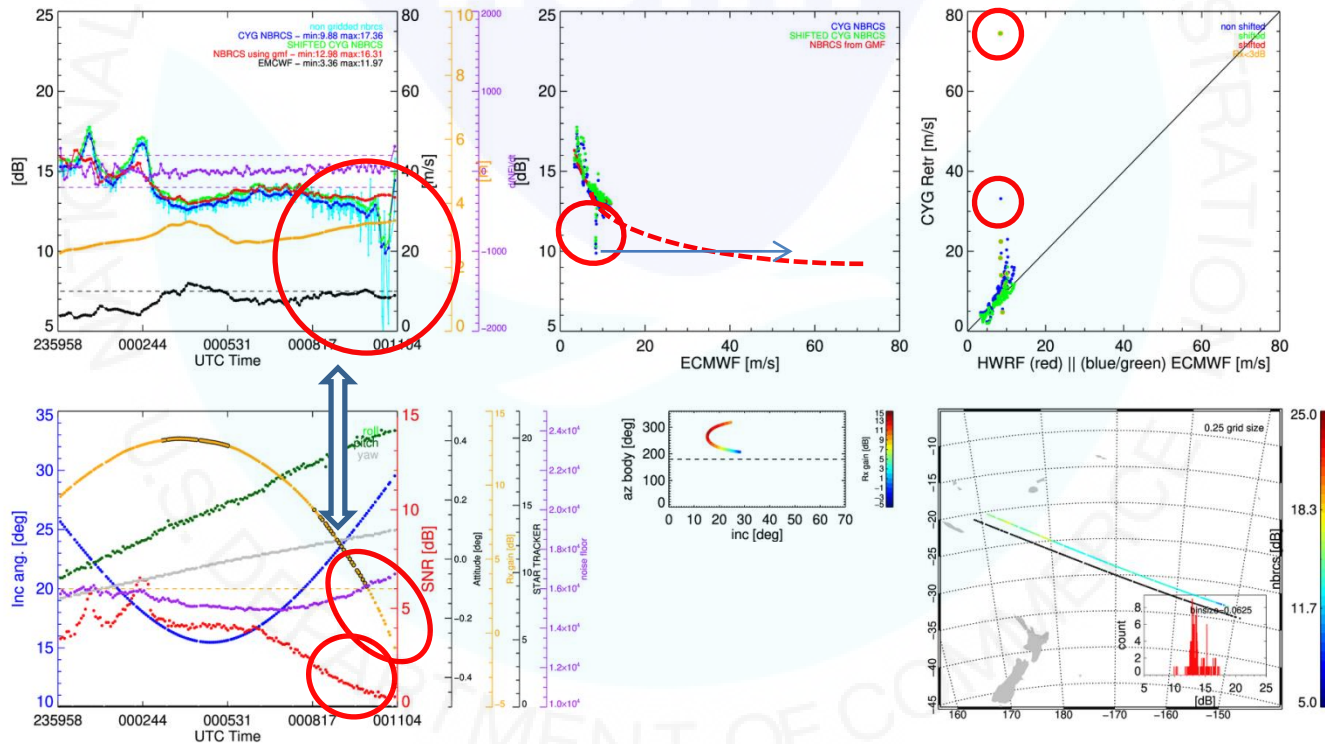

Data processing chain and product content description

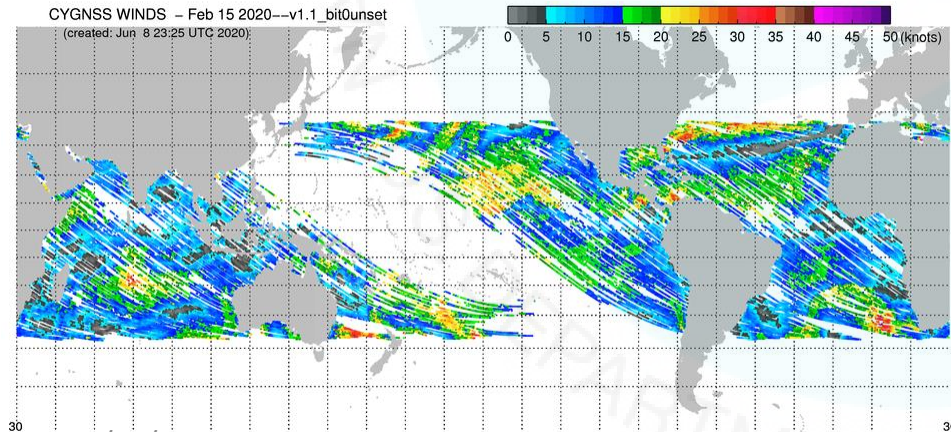

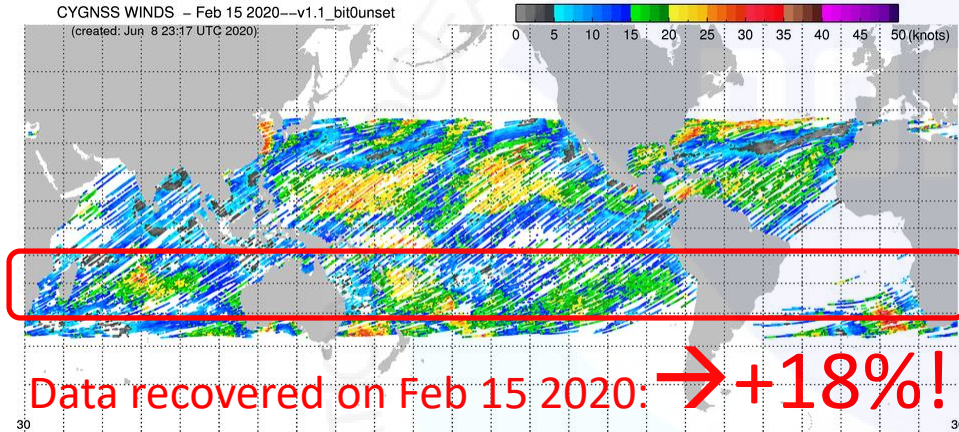

A word about quality control...

- Low Rx gain combined with Low SNR ranges mostly filtered out
- Algorithm implemented to detect block IIF tracks affected by power flex event
- Roll, Pitch, Yaw > 5 deg
- Track associated to Starboard antenna but showing on the Port side and vice versa

A word about quality control...

- Data with Star tracker flag set **now included** and partially flagged (bit 6 of quality flag)

Between May 1st 2017 until Oct 15th 2019:

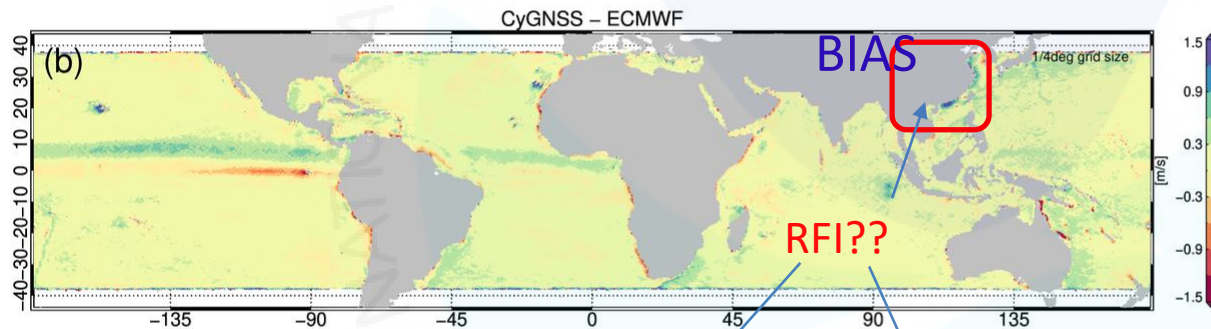

- % of full data set with star tracker flag set: ~17.85
→ Now only flagging about 4.82% of the full data set

NOAA v1.1 overall performance

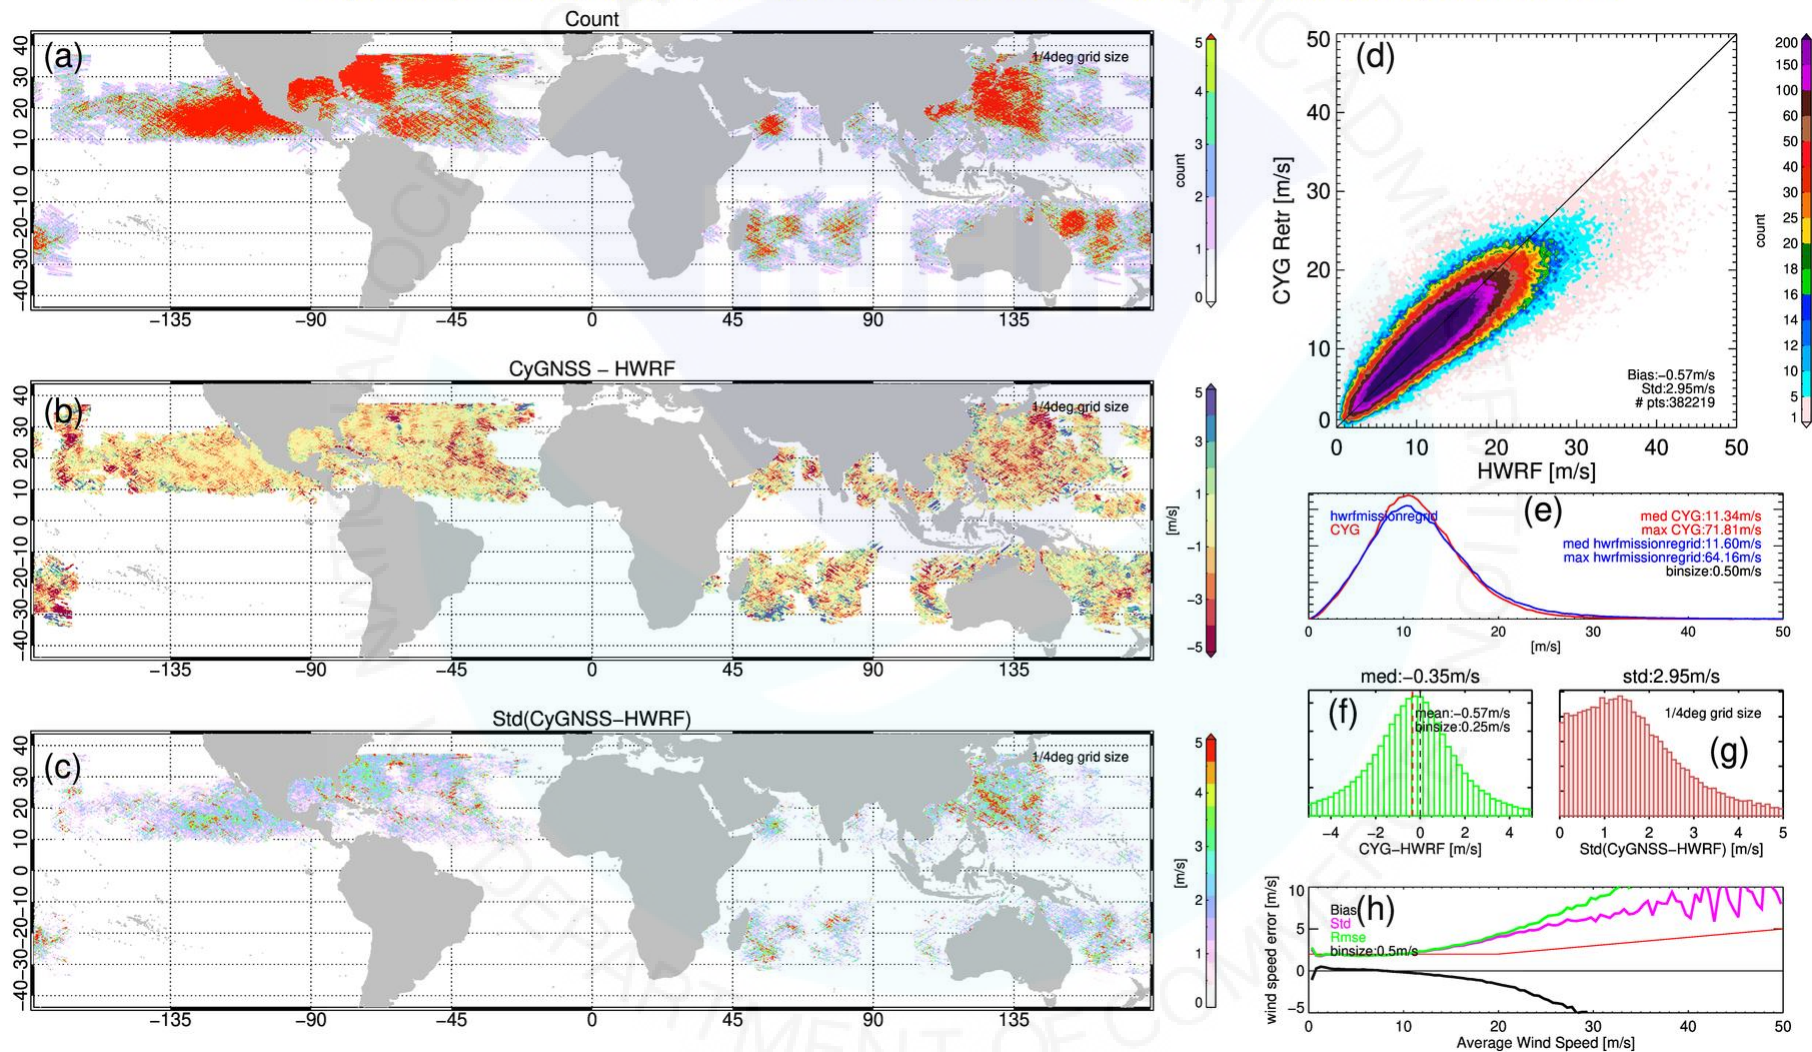

Overall performance against ECMWF – v1.1

v1.1 | all FMs | All blocks | both_ant | | Time period: 2017 May 1st–2019 Oct 05th | NOAA L2 dataset | time window:N/A

Overall performance against HWRF – v1.1

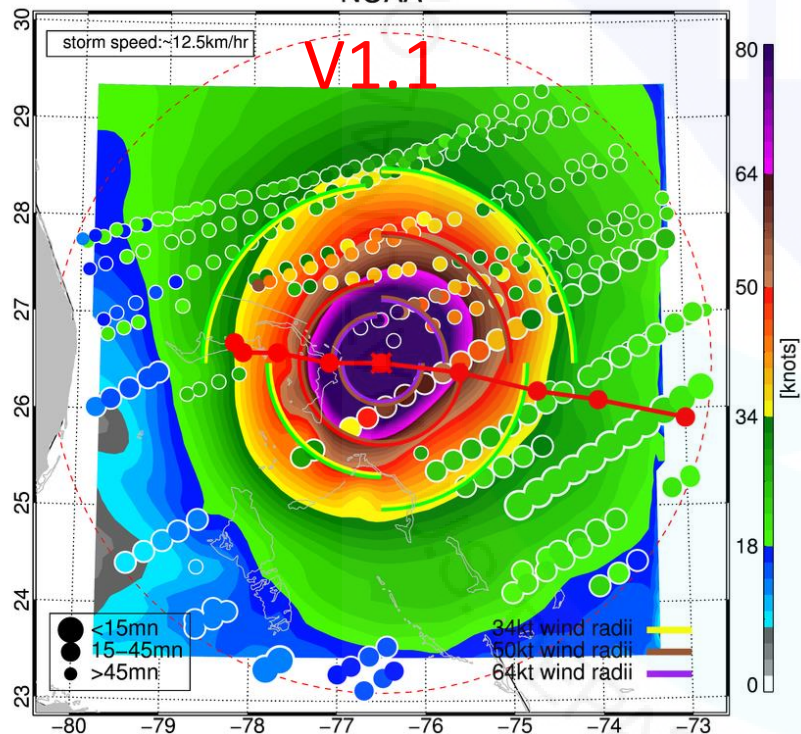

v1.1 | all FMs | All blocks | both_ant | | Time period: 2017 May 1st–2019 Oct 05th | NOAA L2 dataset | time window:N/A

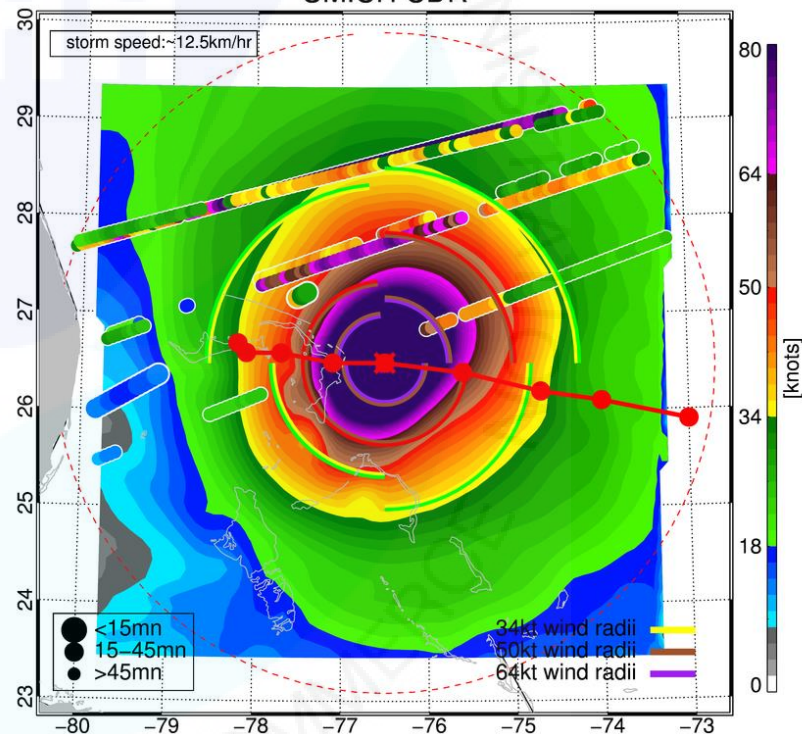

Example TC overpass

Future works

- Will begin assessing the possible impact of CYGNSS data on NOAA operations
- Recall that Roll, Pitch, Yaw > 5 deg data is currently flagged out. Plan is to figure out how much of the high roll angle data can be recovered

Future works

- Carefully inspect v3.0 sigma0 performance

What's going on here?

Originally noticed these sigma0
'drifts' in v2.1..

10/21/2020

RFI?
Rx gain?
EIRP?
All of the above?

Lessons learned

When designing spacecraft, ensure

- absence of inter-satellite σ_0 biases
- absence of σ_0 biases between receive antennas
- verify σ_0 dependence as a function of incidence angle
- absence of biases due to GPS block type
- no attitude variation impact to the σ_0
- Resiliency to signal drift
